

Genetically modified grass blamed for mass cattle deaths in Texas

A form of genetically modified grass is being cited as the likely culprit in the sudden death of a herd of cattle in Central Texas, according to CBS News. Preliminary tests revealed that the grass, an altered form of Bermuda grass known as Tifton 85, had mysteriously begun producing cyanide gas. Scientists at the U.S. Department of Agriculture are conducting further tests to determine if some sort of mutation caused the grass to suddenly begin giving off the deadly gas.
