

## Complaint against EU authorisation of GM soybeans

Several organisations such as the European Network of Scientists for Social and Environmental Responsibility (ENSSER) are filing a complaint against a decision of the EU Commission to authorise a new genetically engineered Monsanto soybean. The soybeans will be mostly sold and grown in Brazil under the brand name Intacta, the harvest will be imported to the EU for use in food and feed.

The new genetically engineered soybean expresses an insecticidal protein and is resistant to the herbicide glyphosate, commonly known as Roundup. The EU gave permission for use of the soybeans in food and feed at end of June. However, the European Food Safety Authority EFSA has not carried out the risk assessments for this product in the way as legally required. This is evident from a technical dossier compiled by Testbiotech and from a legal dossier that will be filed to the Commission.
