

Could stem cells hold the key to treating traumatic brain injuries?

As part of Rainbow Coral Corp.'s mission to deliver effective new cures for traumatic brain injury, the company is investigating promising research on the potential of stem cell therapy to improve the lives of millions suffering from the affliction.

Scientists within the U.S. medical community have begun to see positive results from the treatment of patients with traumatic brain injury (TBI) through the use of stem cells. Significant improvements are seen between three to six months after treatment in brain injury patients.
