

Sustainable impact of biotech crops

A review of available scientific evidence about genetically modified (GM) crops clearly indicates their benefits for environmental sustainability and managing drought, according to an article by [New Scientist](#).

“By reducing the need for tilling, for example, GM crops have enabled farmers to cut their greenhouse gas emissions, a small but important contribution to the fight against climate change. And GM promises more: creating drought-resistant crops that will thrive in the warmer climates of the future, for instance,” it points out in the October issue of the magazine.
