

Scientists create transgenic chicken unable to contract Avian Flu

The H5N1 avian flu virus, which ministers of health propaganda around the world have been using for years to generate overblown panic and fear, is the subject of a new biotechnology project involving genetically-modified (GM) chickens. According to the U.K.'s *Guardian*, genetic manipulators have developed a transgenic variety of chicken that they claim is unable to transmit avian flu to other birds, even after contracting it themselves.
