

Genetic screening uncovers risky matches at the sperm bank

Within the next year, women choosing a sperm donor may be able to use a genetic-analysis service that identifies those with DNA that could cause disease if combined with their own.

Sperm donors are already screened for a handful of genetic conditions, and recipients can choose between donors based on qualities such as height, athleticism, and education. A more detailed analysis of how donor DNA would combine with the recipient's DNA would be the next step.
