

Groundbreaking tech — including GM — smothered by anti-technology ideologues

The following is an excerpt

Groundbreaking new technologies commonly face intractable opposition from various quarters—often from vested interests or societal Cassandras. The anti-vaccination movement has been active since immunization against disease began in the 18th century...

Genetic engineering applied to agriculture has suffered a similar fate since it emerged on the scene about two decades ago. The technology, technically called recombinant DNA technology and also known as “gene-splicing” or “genetic modification” (GM), already has made tremendous contributions to agriculture, particularly among small farmers in poor countries.
