

Connecticut passes first GE labeling bill with qualifications

The following is an edited excerpt.

Connecticut on Monday became the first state to pass a bill that would require food manufacturers to label products that contain genetically modified ingredients — but only after other conditions are met.

Gov. Dannel P. Malloy has said he would sign the bill into law, after reaching an agreement with the legislature to include a provision that the law would not take effect unless four other states, at least one of which shares a border with Connecticut, passed similar regulations.

The Connecticut bill also hinges on those states including Northeastern states with a total population of at least 20 million.
