

Unraveling five popular anti-GE claims

The following is an edited excerpt.

The mainstream scientific community, specific science organizations and the scientific literature converge on the conclusion that genetically modified foods are safe for human consumption. However, anti-GMO zealots oppose genetically modified foods for a variety of ideological reasons. They attempt to prop up their pseudoscientific beliefs by dressing up their assertions and make them appear scientifically credible.

There is a popular anti-GMO message that is making its way across the Internet in various forms. It contains five claims that allegedly support the notion that GMOs are “a recipe for global famine”. This post critically investigates these five claims.
