

Pooping Canada geese may have spread GM wheat seeds

Canada geese may have spread viable seeds of genetically modified wheat grown at the Central Experimental Farm, documents from Agriculture Canada show.

The odds aren't high, the department says.

But the geese ate the experimental wheat last summer at the Experimental Farm. Geese are voracious eaters and leave droppings every few minutes.

The fear is that these geese may have left poop with living GM wheat seeds that could allow GM wheat to spread outside the controlled field, or even away from the farm itself.
