

## NaturalNews endorses GMOs as solution to bee crisis

Here we go again, folks. Recently Natural News published an article titled “New, all-natural pesticide unveiled by scientists – and it won’t kill the bees!”

Good news on the honeybee front — a team of scientists in the UK have created a biopesticide made from spider venom and plant protein that may provide hope for the endangered pollinators.

A study published in the research journal *Proceedings of the Royal Society B* states that the experimental, nontoxic **biopesticide Hv1a/GNA** is “unlikely to cause detrimental effects on honeybees.”

Let’s just take a little peek at the source document – [“Proceedings of the Royal Society B,”](#) shall we?

**Recombinant** GNA, and the **fusion protein Hv1a/GNA** were produced in the yeast expression system...

So, according to Natural News, genetic engineering, cloning and mutagenesis are “all natural.” So much for labels. Need I say more?
