

Can hormones explain why people cheat?

The GLP aggregated and excerpted this blog/article to reflect the diversity of news, opinion and analysis.

Why do people cheat? Despite that humans are considered a primarily monogamous species, adultery is far from a rare occurrence historically and across cultures. However, studies show that some people are more likely than others to become involved with someone else while in a romantic relationship.

AsapSCIENCE explores the current research on infidelity, ranging from hormones and genes to social status, to answer the question of what makes someone a cheater.
