

Homeopathic remedies containing deadly wolfsbane available at CVS

The GLP aggregated and excerpted this blog/article to reflect the diversity of news, opinion and analysis.

Homeopathic drugs contain some pretty strange ingredients. These drugs (or perhaps I should call them potions) come in ordinary-looking packages, apparently designed to look just like real medicine, but they are not. Inside the bottles are concoctions of a wide variety of plant extracts and other substances, almost none of them effective for what's written on the package.

This week I was browsing the headache remedies at [CVS](#), and I encountered a treatment I hadn't seen before: Nova Headache Complex. It's an expensive homeopathic remedy, advertised at \$16.29 for a 50-ml bottle.

So: what does Nova's Headache Complex contain? According to the package, it contains Aconitum Napellus 12X. [Aconitum napellus](#) is a lovely flowering plant, commonly known as monk's hood or wolfsbane. If that sounds ominous, it should: Wolfsbane contains several highly poisonous compounds. It's listed at #3 in [the top 10 deadliest plants](#) at Zitbits.
