

Year in review: How did transhumanism fare in 2015?

The GLP aggregated and excerpted this blog/article to reflect the diversity of news, opinion and analysis.

A year ago, I wrote that 2014 was a great year for the transhumanism movement. But 2015 was simply incredible — it might end up being called a breakout year. I'm not yet willing to declare transhumanism as "mainstream," but it's getting quite close now. Transhumanism has [become a word](#) that is used frequently by people around the world and in major media when discussing radical science and technology changing our species.

One of the most [in-depth profile stories](#) this year was written by Tim Maughan of *BBC Future*, highlighting a day in Washington DC with [Transhumanist Party](#) members and my transhumanism speech at the World Bank. The long article was the 2nd lead story on the *BBC.com* for almost a full day, and also appeared in various translations on foreign BBC sites, like [BBC Hindi](#) and *BBC Portugal*.

Another well-read piece covering transhumanism and longevity issues this year was a *Popular Science* [weekend feature](#). Also, Vox's Dylan Matthews wrote a [brilliant series](#) of articles on transhumanism and the Immortality Bus, as did [The Telegraph's](#) Jamie Bartlett. Additionally, CNET's Eric Mack wrote a [major story](#) that was balanced and entertaining. *TechCrunch* ran a [challenging article](#) of mine on artificial intelligence, and *The Daily Dot* also published a fun one on my campaign and what it's like [to get a biohacker implant](#).
