

Talking Biotech: NAS committee member Neal Stewart on GM crops: It's all safe, environmentally friendly

Talking Biotech returns with an interview with University of Tennessee's Dr. Neal Stewart, who is also a member of the National Academy of Science's committee responsible for the recent report that concluded [GMOs to be safe](#). The [Genetically Engineered Crops report](#) was commissioned by the National Academies of Science, and a committee was convened to review the current literature. The committee also considered testimony of experts, including self-described experts. A wide range of opinions were considered.

This week's podcast summarizes the findings of the committee, along with specific questions to Dr. Neal Stewart, a member of the NAS committee.

The podcast concludes with Dr. Stewart's song on genetic engineering. [You can read more about his philosophy of how science and music mesh here.](#)

The NAS Panel member presentation was edited, mostly to remove crowd noise or references to slides you can't see in an audio podcast.
