

Nebraska agronomist Don Lee, Journey of a Gene co-creator, on how genetic engineering can address crop disease

The processes of biotechnology can be a bit of a black box, and that does not help further its understanding or acceptance. The Journey of a Gene is an interactive, multimedia resource that can aid in explaining the process of genetic engineering. This week's podcast features University of Nebraska-Lincoln agronomist Don Lee, one of the developers of the resource. From teachers to ag producers to extension professionals, this interactive web resource details the process of genetic engineering using the example of solving soybean disease Sudden Death Syndrome. Hosted by Dr. Paul Vincelli (@Pvincelli).
