

Video: Quick and simple guide to creating babies using IVF

In vitro fertilization (IVF) has changed dramatically ever since the first baby to be conceived by IVF was born in 1977. Thanks to advances in IVF research, doctors can better help couples with fertility issues in producing a biological child by controlling the fertilization process. However, the process still features several complications and a less than 100% success rate. How do doctors specifically carry out this procedure and what sort of improvements are being made to make the process easier?
