Medical school investigation finds 'no evidence' Monsanto ghostwrote paper on safety of herbicide glyphosate

After a quick investigation, officials at a medical school in New York State say they have found "no evidence" that a faculty member violated the school's prohibition against authoring a paper ghostwritten by others. The statement came one day after *Science* Insider reported [March 22. 2017] that New York Medical College (NYMC) in Valhalla, New York, would examine a researcher who, according to internal documents released last week by a federal court in California, put his name on a 2000 paper partially ghostwritten by employees at Monsanto, the giant agricultural chemicals company based in St. Louis, Missouri.

. . .

At issue is a 2000 paper published in the journal *Regulatory Toxicology and Pharmacology*. It concluded that a review of studies of one of Monsanto's most successful products, the widely-used herbicide Roundup, showed no evidence of harmful effects on people. The lead author on the paper is Gary Williams, a pathologist at NYMC. His last name appears briefly in documents unsealed last week as part of a lawsuit against Monsanto by people alleging they developed non-Hodgkin's lymphoma from exposure to Roundup and its primary ingredient, glyphosate.
